

Switch Server by SMS Command

Firstly, suggest testing samples on our platform to ensure the devices and SIM cards work properly. Once confirmed, you can switch the devices to your own or a 3rd-party platform using SMS commands.

Kindly find below the SMS command list and the corresponding setup steps will be following:

Set center number	pw,123456,center,phone_number#
Set SOS1	sos1,phone_number#
Set SOS2	sos2,phone_number#
Set SOS3	sos3,phone_number#
Check device status	ts#
Change IP and Port	ip,a.igps123.com,8888#
Set APN	apn,cmnet,,46000#
Change IMEI	imei,IMEI_number#

1. Set your mobile number as the center number of the tracker device - send the SMS below:

- pw,123456,center,phone_number#

Note: replace the cyan-filled part with your actual mobile number

2. Set your platform's server information - Message the SMS below from your mobile number to the tracker device:

- ip,url_or_ip,port_number#

Note: Replace the green-filled part with your actual url or ip address, and the yellow-filled part with your actual port number.

For example (to connect our server),

- ip,a.igps123.com,8888#
- ip,47.106.163.223,8888#

Tip: You can always switch the device back to our tracking platform by sending either of the above two commands again.

Once these steps are completed, you should be able to see the device appears at the backend of your tracking platform, then you proceed with the protocol files for integration.
